

Care Guidance Summary for Muhammad Zayyam Hassan

Patient Details

- Patient name: Muhammad Zayyam Hassan
- Patient record id: PT-4AE48A
- Age: 24
- Sex: Male
- Known conditions: not documented in profile

Doctor Name

- Doctor: Rayyan (Diabetes Care)

Patient Metrics and Context

- Age: 24
- Sex: Male
- Height: 175 cm
- Weight: 68 kg
- HbA1c: 5.2%
- Fasting glucose: 90 mg/dL
- Random glucose: 130 mg/dL
- Total cholesterol: 150 mg/dL
- HDL: 40 mg/dL
- LDL: 90 mg/dL
- Triglycerides: 190 mg/dL
- BMI: 22.2
- Blood pressure: 120/88 mmHg
- Smoking: Never
- Drinking: Never
- Exercise: Heavy
- Risk context: medium diabetes risk (56%) based on the latest available model-supported assessment.
- The latest model output suggests higher diabetes risk (56%).
- Random glucose 130 mg/dL is mildly elevated and worth monitoring over time.
- Blood pressure 120/88 mmHg is above the preferred range and should be rechecked.
- Triglycerides 190 mg/dL are elevated.
- HbA1c 5.2% is currently in a reassuring range.
- Fasting glucose 90 mg/dL does not currently suggest fasting dysglycemia.
- BMI 22.2 is within a healthy range for metabolic risk reduction.

Lifestyle Recommendations

- Maintain the current glucose-friendly eating pattern to preserve HbA1c 5.2% and fasting glucose 90 mg/dL. Focus on eating a balanced diet with plenty of vegetables, whole grains, lean proteins, and healthy fats. This can help maintain steady blood sugar levels.
- Preserve the current heavy exercise routine while building in recovery,

Care Guidance Summary for Muhammad Zayyam Hassan

hydration, and blood-pressure awareness. Start incorporating physical activity into your routine by aiming for at least 150 minutes of moderate-intensity aerobic exercise per week, such as brisk walking, cycling, or swimming.

- Because blood pressure is 120/88 mmHg, emphasize sodium awareness, regular aerobic activity, and repeat BP checks. Monitor your blood pressure regularly, as your diastolic reading is slightly elevated. Lifestyle changes like reducing salt intake and increasing physical activity can help.
- Aim for 7-9 hours of quality sleep per night, as poor sleep can affect blood sugar control and overall health.
- Manage stress through mindfulness practices like deep breathing, meditation, or yoga. High stress levels can impact blood sugar and overall well-being.
- Track meal patterns around higher glucose readings and reinforce carbohydrate quality. Aim for at least 28 grams of fiber per day (based on a 2,000-calorie diet) to support digestive health and blood sugar control. Include foods like beans, lentils, whole grains, fruits, and vegetables.

Medication Recommendations

- Primary option for clinician review: Unknown. A 24-year-old male with a normal BMI and no known diabetes diagnosis presents with an HbA1c of 5.2% and fasting glucose of 90 mg/dL, both within normal ranges. The patient has no reported conditions, medications, or allergies, but diabetes risk assessment indicates a low but non-negligible risk score.
- A 24-year-old male with a normal BMI and no known diabetes diagnosis presents with an HbA1c of 5.2% and fasting glucose of 90 mg/dL, both within normal ranges. The patient has no reported conditions, medications, or allergies, but diabetes risk assessment indicates a low but non-negligible risk score.
- Safety and validation notes: No medication is justified for diabetes prevention or treatment in this patient given normal HbA1c and fasting glucose levels. Renal status is unknown; caution is advised if future pharmacological intervention is considered. Focus on lifestyle interventions and monitoring for diabetes risk.

Monitoring Plan

- Repeat HbA1c at the usual clinician-directed interval to confirm stability from the current 5.2% baseline.
- Monitor fasting or home glucose trends against the current 90 mg/dL baseline.
- Repeat blood pressure readings and compare against the current 120/88 mmHg baseline.
- Review the lipid profile at follow-up so cardiovascular prevention advice stays targeted.

Next Steps

- The latest model output suggests higher diabetes risk (56%).
- Maintain the current glucose-friendly eating pattern to preserve HbA1c 5.2% and

fasting glucose 90 mg/dL. Focus on eating a balanced diet with plenty of vegetables, whole grains, lean proteins, and healthy fats. This can help maintain steady blood sugar levels.

- Primary option for clinician review: Unknown. A 24-year-old male with a normal BMI and no known diabetes diagnosis presents with an HbA1c of 5.2% and fasting glucose of 90 mg/dL, both within normal ranges. The patient has no reported conditions, medications, or allergies, but diabetes risk assessment indicates a low but non-negligible risk score.
- Repeat HbA1c at the usual clinician-directed interval to confirm stability from the current 5.2% baseline.
- Monitor fasting or home glucose trends against the current 90 mg/dL baseline.

Overview

Muhammad Zayyam Hassan is a 24-year-old male with medium model-predicted diabetes risk (56%). Current profile: HbA1c 5.2%, fasting glucose 90 mg/dL, BMI 22.2. Key protective factors include HbA1c 5.2% is currently in a reassuring range. and Fasting glucose 90 mg/dL does not currently suggest fasting dysglycemia. Main issues to address now: The latest model output suggests higher diabetes risk (56%). Random glucose 130 mg/dL is mildly elevated and worth monitoring over time.

Risk Summary

medium diabetes risk (56%) based on the latest available model-supported assessment.

Risk Narrative

Risk is in the moderate range. Top features show which inputs the model relied on.

Clinical Snapshot

- Age: 24
- Sex: Male
- Height: 175 cm
- Weight: 68 kg
- HbA1c: 5.2%
- Fasting glucose: 90 mg/dL
- Random glucose: 130 mg/dL
- Total cholesterol: 150 mg/dL
- HDL: 40 mg/dL
- LDL: 90 mg/dL
- Triglycerides: 190 mg/dL
- BMI: 22.2
- Blood pressure: 120/88 mmHg
- Smoking: Never
- Drinking: Never

Care Guidance Summary for Muhammad Zayyam Hassan

- Exercise: Heavy

Protective Factors

- HbA1c 5.2% is currently in a reassuring range.
- Fasting glucose 90 mg/dL does not currently suggest fasting dysglycemia.
- BMI 22.2 is within a healthy range for metabolic risk reduction.
- Current heavy exercise pattern is a strong protective lifestyle factor.
- No active smoking exposure is documented.
- Alcohol intake is not adding a current metabolic burden in the profile.

Active Concerns

- The latest model output suggests higher diabetes risk (56%).
- Random glucose 130 mg/dL is mildly elevated and worth monitoring over time.
- Blood pressure 120/88 mmHg is above the preferred range and should be rechecked.
- Triglycerides 190 mg/dL are elevated.

Key Risk Drivers

- TOTAL CHOLESTEROL (impact +0.66)
- HEIGHT CM (impact +0.63)
- HBA1C (impact +0.62)
- WEIGHT KG (impact +0.59)
- DIASTOLIC BP (impact +0.46)
- SEX (impact +0.40)

Doctor Considerations

- Medication safety notes requiring clinician attention: No medication is justified for diabetes prevention or treatment in this patient given normal HbA1c and fasting glucose levels. Renal status is unknown; caution is advised if future pharmacological intervention is considered. Focus on lifestyle interventions and monitoring for diabetes risk.
- No chronic conditions are documented in the current patient profile, so recommendations are driven mainly by vitals, labs, and lifestyle history.
